## Content

The subjects are chosen from

1. **Linear Algebra:** Vector spaces, matrices and equation systems, linear maps, Jordan-, LU-, QR-, and singular value decomposition, numerical aspects.
2. **Differential Equation:** Linear systems, differential equations with constant coefficients.
3. **Laplace-Transform and Fourier Series**
4. **Differential Calculus with several variables:** Derivatives, inverse and implicit functions, Taylor expansion and extreme values.
5. **Stability of Differential Equations:** Theorems of Ljapunov and Poincaré-Ljapunov.
6. **Variational Calculus**

**Literature:**

- Lang, S., Linear algebra
- Slides

## Competencies

The course gives an introduction to fundamental mathematical techniques used in almost every course. Attention is given to the underlying mathematical structure.

## Examination Requirements

The final exam will be a written (2 hours) exam.

## Formality of Examination

- ☒ Module Finals
- ☐ Accumulated Grade

## Module Requirements (Prerequisites)

## Allocation to Curriculum:

Mandatory Course
Program: Automation & Robotics

## Responsibility/ Lecturer

*Dean of the Mathematics faculty/ Lecturers of the Mathematics faculty*
## Control Theory and Applications

### Content

- Modeling of dynamic systems: First principles models, state space representation, DAE systems, classes of systems, models, and signals, linearity and causality, steady states, operability, singular value decomposition, stability, linearization.
- Linear state space theory: Autonomous behavior, eigenvalues, eigenvectors, Jordan form, controllability and pole assignment, LQ-optimal control, observability, observers, observer-based control, Kalman decomposition.
- Laplace transform and transfer matrices: Introduction to the Laplace transform, transfer functions, poles, zeros, minimal realization, zeros of multivariable systems, frequency response, input-output stability.
- Discrete-time and sampled data systems: z-transform, z-transform of sampled data systems, stability, dead-beat control, \( w \)-transform.

### Literature:

- Handouts

### Competencies

This course provides the students with a solid background in control theory which is a prerequisite to solve automation problems in robotics as well as in production processes of all kinds.

### Examination Requirements

The final exam will be a written (2 hours) exam. In addition, there will be a written midterm exam (1.5 hours).

### Formality of Examination

2. **Storage Technology**: SRAM, DRAM, ROM, magnetic recording, optical recording
3. **Data Communication**: Bus systems, Ethernet, TCP/IP
4. **Memory Hierarchy**: Caches, virtual memory, RAID systems

**Literature:**
- Optical Storage: Alan Marchant, "Optical Recording", Addison Wesley, 1999

## Competencies

By attending this course, students learn the architecture and the components of modern computer systems. This knowledge is directly required for advanced courses on distributed systems and communication systems. As computers are vital components of most robots and complex process automation systems, a basic understanding of computer systems is necessary for most practical work in this area, like project groups and lab courses.

## Examination Requirements

All students are required to successfully complete 2 out of 4 special assignments in order to be admitted to the final exam. The final exam is a written test (3 hours). The grade is solely determined by the final exam.

### Content

1. Matlab Basics, Programming, Visualization
2. Symbolic Computing
3. Statistics
4. Numerical Optimisation
5. Control System Design
6. Simulink
7. Robotics

**Literature:**
Matlab documentation

### Competencies

The course qualifies the students to solve scientific programming and engineering problems with Matlab. The students acquire deeper knowledge in the design and application of control systems and robotics.

### Examination Requirements

- Successful completion of 75% of programming assignments and
- Successful completion of 50% of quizzes

The course grading is pass or fail.

### Formality of Examination

- Module Finals
- Accumulated Grade

### Module Requirements (Prerequisites)

### Allocation to Curriculum:

- Mandatory Course
  - Program: Automation & Robotics

---

**Course 1 or 2**

Students acquire capabilities to communicate private information in past and present, to name and ask for professions or study subjects and to query simple information on job offers. Furthermore, skills to express commands or giving guidance on an entry level, to make appointments or communicate emergencies, e.g. being sick, via phone, are trained. Further skill to be trained are listed but not limited to:

- understand and phrase phone messages
- ask for explanations and express polite support requests or instructions
- query or explain a route to a target
- read or write invitations and express good wishes
- name pieces of clothing and body parts

**Course 3**

Students acquire and apply methods for self– and time–organization, to guide negotiations and presentations, organization of workflows, to handle information plethora, self and object presentation.

---

**Competencies**

Successful completion of this module will grant knowledge of a non–native language and will have gained or enhanced either cultural knowledge or presentation skills for the chosen target nation. Besides enhancing the general scope of education other key competences are supposed to be enabled. The necessity to freely choose classes for this subject is supposed to strengthen unsupervised learning skills and self–motivation related to academic studies.

---

**Examination Requirements**

3 Credits will be rewarded for either taking a class acknowledged for 1 or 2 or 3. Each class has to be passed by a final examination. Modalities of examinations are subject to the responsible lecturer. Passing the examination and assignment of credits shall be marked on a course–passing certificate.

---

**Module Requirements (Prerequisites)**

Each student who chooses a language class for the General Education subject has to opt for a language other than his or her mother language.

---

**Allocation to Curriculum:**

Program: Automation & Robotics

---

**Responsibility/ Lecturer**

*Dean of the faculty of Electrical Engineering and Information Technology*

3. Content

The following topics are discussed in detail:
- Introduction to the term "robot system"
- Components of industrial robot systems: robots, effectors, feeding systems, clamping devices, control and communication systems, safety systems and other peripheral devices
- Interaction of the individual components
- Robot applications in production and manufacturing systems
- Robot applications for assembly tasks

Literature:
- William R. Tanner: Industrial Robots: Applications
- Phillip John McKerrow: Introduction to Robotics

4. Competencies

This lecture treats applications of robotics in the industrial environment. The first part of the lecture focuses on robot systems. On the basis of practical examples the components of industrial robot systems and their interaction in a production process are systematically analyzed and described. Based on this theoretical background an overview of state of the art applications is given, in order to deepen the subjects and to establish the relationship between theory and practice. In addition, actual research work is presented.

5. Examination Requirements

All students are required to solve four assignment problems. The final exam will be an oral (30 minutes) or written (2 hour) exam, depending on the number of participants.

## 3 Content

1. Single Machine Models: Classification, complexity, total weighted completion time, maximum lateness and multiple objectives
2. Parallel Machine Models: Makespan, total completion time, preemption
3. Shop Systems: Flow shop, flexible flow shop, job shop, open shop
4. Online Scheduling: Competitive factors, non clairvoyant scheduling
5. Scheduling in Practice: Computer intelligence, Integer linear programming

### Literature:

- Yves Robert, Frédéric Vivien (ed.): Introduction to Scheduling, CRC Press, 2010

## 4 Competencies

The students know the classification of scheduling problems as well as the application of practical algorithms, heuristics, and methods in order to solve these combinatorial resource allocation tasks. They can evaluate the efficiency of classical solution methods and will be able to develop new solution approaches for complex scheduling problems based on their acquired knowledge.

## 5 Examination Requirements

Dependent on the number of participants the final exam is takes place as oral (40 min) or written exam (2h). The students must successfully participate in the lab course as preparation for the exam.

2 Language: English

3 Content
(a, b) Logic controllers are widely used to supervise the safe operation of equipment, and to enforce desired operating sequences. In many applications, such controllers are realized by Programmable Logic Controllers (PLCs) or Distributed Control Systems (DCSs). The course covers the underlying mathematical models and notions, teaches basic design concepts for logic control, and introduces into the programming of PLCs. In the tutorials, the students design, implement, and test logic controllers for simple examples. The students have to perform a logic controller programming task as a home assignment.

1. Introduction: motivation and application examples for logic control
2. Mathematical foundations: Boolean algebra and functions
3. Hardware realization of logic controllers
4. Fundamentals of PLC programming: PLC operating systems and standard functions
5. Programming languages according to the international standard IEC 61131-3 (including function block diagrams, ladder diagrams, instruction list and structured text programs, and the specification of sequential controls by sequential function charts)

(c) A Process Control Lab consisting of six practical lab experiments (DYN 2, DYN 3, DYN 5, DYN 6, DYN 10, DYN 11) and three computer experiments (DYN 22 a, b, DYN 26) (see appendix A).

Literature:
- J. E. Hopcroft, J. D. Ullman: Introductions to Automata Theory, Languages, and Computation. Addison Wesley, 2000

4 Competencies
In this course, the students learn the importance of logic control and the state of the art of the technology used to implement such controllers. They can analyze and formalize the tasks of a logic controller and can formally specify its behavior. They are able to implement simple logic controllers and to apply modern techniques to their analysis. They can evaluate the complexity of a logic control task. The Process Control Laboratory allows the students to apply control theory from this and other courses to realistic example problems.

5 Examination Requirements
The final exam will be an oral (30 minutes) or written (2 hour) exam, depending on the number of participants (form will be announced in the second week of the course). In addition, there will be a graded home assignment. The requirements for the laboratory are described in appendix A.

1. Identification of simple models from step responses.
3. Modeling using nonlinear black box models (perceptron neural nets, radial-basis-function nets), training, dynamic models, quality of neural net models.

The course takes place in the second half of the semester.

Literature:
- Slides
- Handouts

Competencies
The students can identify the dominant dynamics of a process from step responses and can apply modern methods and algorithms to identify the parameters of linear process models from measured data. They know the structure of nonlinear black box models and can judge the quality and the limitations of data-based models.

Examination Requirements
The final exam will be an oral (30 minutes) or written (2 hours) exam, depending on the number of participants (form will be announced in the second week of course). In addition, there will be a graded homework.

Formality of Examination
- Module Finals
- Accumulated Grade

Module Requirements (Prerequisites)
Basic knowledge of dynamic systems as e.g. provided by the course Control Theory and Applications.

Allocation to Curriculum:

#### Language

English

#### Content

The course gives an overview of state-of-the-art process optimization techniques and of their application. The following topics are dealt with:

- Scalar and multivariable optimization
- Linear and nonlinear programming, direct and indirect methods
- Constrained Optimization
- Evolutionary Algorithms
- Nonlinear Programming with Equality and Inequality Constraints

The course takes place in the second half of the semester.

#### Competencies

The students acquire an in-depth knowledge of methods and technologies for the improvement of chemical and biochemical production processes by optimization. The students acquire a comprehensive overview of the industrial practice in this area.

#### Examination Requirements

The final exam will be an oral (20 minutes) or written (1.5 hours) exam, depending on the number of participants (form will be announced in the second week of the course). In addition, the lab must be passed.

#### Formality of Examination

- ✔ Module Finals
- ☐ Accumulated Grade

#### Module Requirements (Prerequisites)

This module is mutually exclusive with the module “Process Performance Optimization”.

By receiving credit points for the module “Process Optimization” you cannot receive credit points the module “Process Performance Optimization”.

### Language: English

### Content

For the majority of living beings vision is the most important perception mechanism for orienting themselves in the environment. Therefore, there exists a multitude of attempts to recreate this capability in artificial systems. In contrast to image processing techniques found in industrial applications the aim of such advanced systems for machine vision is to obtain a task-oriented interpretation of a complex scene with as few restrictions as possible concerning the context and the recording conditions.

In this lecture advanced techniques of machine vision are covered which to some extent are inspired by cognitive processes known from human visual perception. First, important aspects of imaging processes are introduced with an emphasis on the perception of colors. Afterwards, methods for the computation of local feature representations (e.g. texture, depth, or motion) and for the extraction of image primitives (e.g. regions, contours and keypoints) are presented. Finally, the lecture focuses on visual perception processes at the boundary between image processing and scene interpretation. Several appearance based object recognition techniques will be covered, e.g., Bag-of-Features approaches, Eigenimages, and deep Convolutional Neural Networks (CNNs) which define the state-of-the-art for many current computer vision problems.

The accompanying tutorials will give students the opportunity to deepen their knowledge of the theoretical concepts presented in the lecture by working on relevant practical problems.

**Literature:**

### Competencies

In this module students will be made familiar with solutions for advanced problems in the field of machine vision. A fundamental understanding of the principles underlying visual perception systems will enable participants to apply such techniques by themselves in innovative application scenarios - as, e.g., robotics and human-machine interaction – and to assess their strengths and limitations.

### Examination Requirements

The final exam will be an oral (30-45 minutes) exam.

### Formality of Examination

### Language
English

### Content
1. Introduction to projective geometry
2. Linear and nonlinear approaches to the calibration of camera systems
3. 3D reconstruction based on photogrammetric methods, especially bundle adjustment
4. Pattern classification methods for establishing point correspondences between images
5. Model-based 3D pose estimation
6. 3D reconstruction based on the point spread function (depth from focus/defocus)
7. 3D reconstruction of surfaces based on their physical reflectance properties (photoclinometry, shape from shading/polarisation)
8. Technical and scientific applications

**Literature:**
- Horn: Robot Vision
- Klette, Koschan, Schlüns: Computer Vision: Three-Dimensional Data from Images;
- Hartley/Zisserman: Multiple Viewpoint Geometry

### Competencies
The students obtain the ability to understand, develop, and implement 3D computer vision methods and apply them to practical technical or scientific problems.

### Examination Requirements
The final exam will be an oral or written exam (form will be announced in the third week of the course). Each student has to participate in 5 practical programming lectures successfully.

### Formality of Examination
- Module Finals
- Accumulated Grade

### Module Requirements (Prerequisites)
Good knowledge in linear algebra as well as linear and nonlinear optimization.

### Allocation to Curriculum:
Program: Automation & Robotics, Field of study: Robotics, Cognitive Systems
Program: Electrical Engineering und Information Technology (ETIT-233)

### Responsibility/ Lecturer
Prof. Dr. C. Wöhler/ Prof. Dr. C. Wöhler

## Language

**Language**: English

## Content

Different directions of mathematical modeling techniques are introduced that build on the course Advanced Engineering Mathematics and assume a solid background in mathematics. Among the subjects are the following:

1. **Optimization**: Theoretical and practical aspects of optimization problems, formulation, optimality conditions, linear programming, discrete optimization.
2. **Applied partial differential equations**: Prototypes, representation formulae, qualitative and quantitative behavior, conservation laws, elliptic, parabolic and hyperbolic equations, convection-diffusion-reaction systems.
3. **Continuum mechanics**: Inertia and momentum, equations of motion, external forces, conservation laws, deformations.

**Literature**:

References will be given in the courses.

## Competencies

This course offers an introduction to different fundamental techniques of mathematical modeling and analysis that are useful for the dynamics and control of robotic devices. Tools that allow for the description and control of movement and the interaction with the environment are introduced. The ability to create and use models to estimate qualitatively and quantitatively the behavior of dynamic systems will be trained.

## Examination Requirements

The final exam will be an oral (20 minutes) or written (1.5 hours) exam, depending on the number of participants (form will be announced in the second week of the course).

## Formality of Examination

- **Module Finals**
- □ Accumulated Grade

## Module Requirements (Prerequisites)

Course: “Advanced Engineering Mathematics”

## Allocation to Curriculum:

## Responsibility/ Lecturer

Dean of the Mathematics faculty / Lecturers of the Mathematics faculty
## Cyber-Physical System Fundamentals

</tr>
</tbody>
</table>

### 2 Language: English

### 3 Content:
The course is based on the presenter’s book on the subject and includes the following topics:

1. Introduction: Definition of terms, scope of the course
2. Specification and modeling: models of computation, communication models, finite state machines, data flow, discrete event models, von-Neumann-models, expressiveness of models
3. CPS hardware: hardware-in-the-loop, sampling and A/D-conversion, processing, field-programmable gate arrays (FPGAs), communication hardware, D/A-conversion, sampling theorem, output
4. Standard software: embedded operating systems, real-time operating systems, priority inversion, middleware
5. Evaluation and validation: objective functions, Pareto-optimality, worst-case execution time, energy consumption, reliability, real-time calculus, verification
6. Mapping of applications to execution platforms: standard optimization techniques, real-time scheduling, rate monotonic scheduling, earliest deadline first scheduling, hardware/software partitioning, mapping of applications to heterogeneous multiprocessors
7. Selected optimizations.

### Literature:
- Lego Mindstorm NXT Technical documentation
- Technical documentation for the used finite state machine design tool (StateMate or similar)

### 4 Competencies
Students successfully finishing the course should be able to

- Understand how cyber-physical (CPS) hardware interacts with CPS software and use this knowledge to design CPS software,
- Select models of computation and programming languages that are appropriate for a given design problem,
- Select an appropriate scheduling technique for embedded systems, Apply hardware/software design techniques in order to optimize the systems which they are supposed to design.

### 5 Examination Requirements
The students have to pass both the lab and the finals.

### 6 Formality of Examination
- Module Finals
- Accumulated Grade

### 7 Module Requirements (Prerequisites)
Basic knowledge in programming as well as finite-state machines.

3 Content

Logic controllers are widely used to supervise the safe operation of equipment, and to enforce desired operating sequences. In many applications, such controllers are realized by Programmable Logic Controllers (PLCs) or Distributed Control Systems (DCSs). The course covers the underlying mathematical models and notions, teaches basic design concepts for logic control, and introduces into the programming of PLCs. In the tutorials, the students design, implement, and test logic controllers for simple examples. The students have to perform a logic controller programming task as a home assignment.

1. Introduction: motivation and application examples for logic control
2. Mathematical foundations: Boolean algebra and functions
3. Hardware realization of logic controllers
4. Fundamentals of PLC programming: PLC operating systems and standard functions
5. Programming languages according to the international standard IEC 61131-3 (including function block diagrams, ladder diagrams, instruction list and structured text programs, and the specification of sequential controls by sequential function charts)

Literature:

- J. E. Hopcroft, J. D. Ullman: Introductions to Automata Theory, Languages, and Computation. Addison Wesley, 2000

4 Competencies

In this course, the students learn the importance of logic control and the state of the art of the technology used to implement such controllers. They can analyze and formalize the tasks of a logic controller and can formally specify its behavior. They are able to implement simple logic controllers and to apply modern techniques to their analysis. They can evaluate the complexity of a logic control task.

5 Examination Requirements

The final exam will be an oral (30 minutes) or written (2 hour) exam, depending on the number of participants (form will be announced in the second week of the course). In addition, there will be a graded home assignment.

### Content

The students obtain an overview of supply chain management and planning and scheduling problems in the chemical industry and of techniques and tools for modeling, simulation and optimization. These include discrete event simulation, equation-based modeling, mixed-integer linear programming, heuristic optimization methods and modeling and optimization using timed automata.

**Literature:**
- Handouts
- Slides

### Competencies

The students will be enabled to identify logistic problems, to select suitable tools and techniques for simulation and optimization and to apply them to real-world problems.

### Examination Requirements

The final exam will be an oral (20 minutes) or written (1.5 hours) exam, depending on the number of participants (form will be announced in the second week of the course). In addition, active participation and collaboration in 3 computer exercises is required.

### Content

1. Empirical distributions and explanatory data analysis: frequency tables, bar charts, histograms, distribution characteristics
2. Probability theory: conditional probability, independence
3. Random variables and their distributions: discrete distributions (Uniform, Bernoulli, Binomial, Poisson), continuous distributions (Uniform, Normal), expectation and variance, sampling distribution theory, joint distributions, covariance and correlation
4. Estimation: properties of estimators, confidence intervals
5. Test of statistical hypotheses: Binomial test, Gaussian test, t-test, power, p-value
6. Regression: simple/multiple regression, tests concerning regression
7. Time series analysis: stochastic processes, stationarity, autocorrelation, filtering

### Literature:

Slides

### Competencies

This course gives an introduction to statistical concepts that are useful for research projects in various fields of application and areas of science. Furthermore, the students should get a good grasp of the application of these concepts to engineering problems like prediction, optimal testing and estimation.

### Examination Requirements

All students are requested to solve four take home problems. The final exam will be an oral or a written exam, depending on the number of participants (form will be announced second week of course).

3 Content

Real-time systems play a crucial role in many modern applications and systems, especially when data processing units need to be integrated into physical systems. This module provides basic and advanced knowledge about real-time systems themselves and their application. The events in this module cover the design and analysis to ensure compliance with real-world system conditions. This knowledge is deepened and practiced in the exercises. The module is particularly suitable for students who are interested in research around Cyber Physical Systems and Embedded Systems. Literature: Slides

4 Competencies

The students understand the basic concepts for the design and analysis in real-time systems, in particular worst-case analyzes. Students should be enabled to apply current procedures for verifying the schedulability of real-time systems and scheduling algorithms.

5 Examination Requirements

The final exam will be an oral exam.

**Language:** English

**Content**

Since the course covers three different aspects of computational intelligence, the contents can best be described following this division into three parts:

1. **Artificial Neural Nets:** After a short introduction with reference to the biological paradigm, an introduction to threshold logic sets the basics for neural nets. The most important types of nets are covered namely the perceptron, one- and two-layered nets, and Hopfield nets. Supervised and unsupervised learning is discussed, the backpropagation algorithm and enhancements. The content is presented in a way that emphasis the practical and implementation aspects as well as theoretical considerations like limitations and complexity issues.

2. **Evolutionary Algorithms:** Again stemming from a natural source of inspiration evolutionary algorithms are introduced as an example from the class of general randomized search heuristics. After a description of the main modules (initialization, selection, crossover, and mutation) comes a discussion of typical parameter settings for population sizes and crossover and mutation probability. Then theoretical aspects are considered, the focus is on the analysis of the mean convergence rates.

3. **Fuzzy Logic:** This final part starts with an introduction to fuzzy sets and fuzzy logic using fuzzy relations and the concept of fuzzy inference. Applications like fuzzy clustering and fuzzy controllers are discussed.

**Literature:**

**Competencies**

Computational Intelligence is used as an umbrella term for different approaches that deliver enhanced performance and applicability. It encompasses artificial neural nets, evolutionary algorithms, and fuzzy logic. This course gives a thorough introduction into all three aspects of computational intelligence from the perspective of computer science. It focuses on theoretical aspects as well as typical application scenarios. After attending the course students are expected to have a basic understanding of the working principles, application areas and limitations of the three approaches.

**Examination Requirements**

Mandatory prerequisite for an admission to the module examination is the successful solution of 50 % of the homework presented and discussed in the tutorial. Final module exam is a written exam (90 minutes).

### 2 Language: English

### 3 Content: Discretization and solution techniques for the numerical simulation of problems in continuum mechanics, as well as their efficient treatment on computer systems are introduced. The course Advanced Engineering Mathematics, a solid background in mathematics, and solid programming skills are assumed. Among the subjects are the following:

1. **Practical finite elements:** Variational formulation of partial differential equations, weak solutions, Ritz-Galerkin techniques, finite element approximation and analysis, numerical integration, boundary approximation, mesh generation, error control and reliability, solution of linear systems.

2. **Computational aspects of fluid dynamics:** Conservation laws, compressible and incompressible fluids, spatial discretization (FD, FV, FEM), stabilization techniques, explicit and implicit time stepping schemes, treatment of boundary conditions, projection- and operator-splitting -techniques.

3. **High performance computing:** Parallel computer architecture, performance-oriented programming, sparse numerical linear algebra, Krylov-subspace and multigrid solvers, preconditioning strategies, domain decomposition methods, shared and distributed memory parallelization with OpenMP and MPI, GPU Computing.

4. **Approximation theory:** Interpolation and approximation, polynomial spaces, splines and Bézier curves, existence and uniqueness, best-approximation properties, quasi-interpolation, quality assessment and error analysis.

**Literature:** References will be given in the courses.

### 4 Competencies

This course provides students with fundamental mathematical simulation techniques that are essential to solve automation problems in robotics as well as in production and engineering processes of all kinds. The entire simulation pipeline is covered in theory and practice. Students are trained to solve real-life complex problems in “Numerics Labs”.

### 5 Examination Requirements

The final exam will be an oral (20 minutes) or written (1.5 hours) exam, depending on the number of participants (form will be announced in the second week of the course).

</tr>
</tbody>
</table>

## Language
- English

## Content
Many chemical and most biochemical production processes are performed as batch processes where finite quantities of material undergo a sequence of production steps in one or several pieces of equipment. Batch processes differ from continuous processes as they are transient (non-stationary) in nature and often different products are produced in the same equipment, leading to scheduling problems. The course extends the knowledge of the students in the field of operation and control of batch processes. It covers the current standards for batch automation as well as the monitoring, control and optimization of individual batch runs.

### Literature:
- Handouts
- Slides

## Competencies
After the course, the students understand the fundamental differences between batch and continuous operation. They know the standards for batch automation and can interact with automation engineers in this domain. They are able to apply state-of-the-art monitoring, control and optimization techniques in industrial batch processes.

## Examination Requirements
The final exam will be an oral (20 minutes) or written (1.5 hours) exam, depending on the number of participants (form will be announced in the second week of the course). In addition, there will be a graded homework.

## Module Requirements (Prerequisites)
Basic knowledge of mathematical modeling, dynamic systems, and control, as e.g. provided by the course Control Theory and Applications.

## Allocation to Curriculum:
- Program: Automation & Robotics, Field of study: Process Automation

## Responsibility/ Lecturer
- Prof. Dr. S. Engell/ Prof. Dr. S. Engell

English

3 Content

The course gives an overview of state-of-the-art techniques and of their applications to optimize the performance of chemical and biochemical production processes. The following topics are dealt with:

- Selection of controllers and control structures
- Tuning of standard controllers
- Optimization of the operating conditions by linear programming and nonlinear optimization
- Model predictive control
- Batch trajectory optimization
- Model-based estimation of process variables for monitoring and control
- Process performance monitoring
- Dynamic simulation and operator training systems
- Manufacturing Execution Systems
- Statistical Process Control, Six Sigma
- Operation of regulated life science processes

Literature:

- Handouts
- Slides

4 Competencies

The students acquire an in-depth knowledge of methods and technologies for the improvement of chemical and biochemical production processes by advanced control, model-based methods, data analysis and optimization and continuous improvement. The students acquire a comprehensive overview of the industrial practice in this area.

5 Examination Requirements

The final exam will be an oral (30 minutes) or written (2 hours) exam, depending on the number of participants (form will be announced in the second week of the course). In addition, the successful completion of the lab experiments (including report and final discussion) is required.

6 Formality of Examination

☐ Module Finals  □ Accumulated Grade

7 Module Requirements (Prerequisites)

This module is mutually exclusive with the module “Process Optimization” By receiving credit points for the module “Process Optimization” you cannot receive credit points the module “Process Performance Optimization”.

Basic knowledge of dynamic systems and control is required, as e.g. provided by the course Control Theory and Applications.

3 Content

- Specification of controller design tasks, design using frequency response approximation performance limitations in SISO control loops.
- I/O-system description of multivariable systems, poles, zeros, zero directions, stability criteria.
- Classical Design Techniques: Decoupling, sequential loop closure, approximate decoupling, multivariable frequency response approximation, robustness.
- Control Structure Selection: Static and dynamic controllability analysis, plant directionality, relative gain array, computation of the attainable performance.

The course takes place in the first half of the semester.

Literature:

4 Competencies

After this course, the students will be able to design multivariable controllers for chemical and biochemical processes based on input-output descriptions. They are aware of the limitations of controller performance in the scalar and in the multivariable case and of the influence of plant-model mismatch on controller performance. They can apply modern tools to the selection of control structures.

5 Examination Requirements

The final exam will be an oral (20 minutes) or written and computer-based (1.5 hours) exam, depending on the number of participants (form will be announced in the second week of the course).

Active participation and collaboration in 75% of computer exercises is mandatory.

6 Formality of Examination

3 **Content**

In the past years the energy system has changed drastically. Due to environmental and political reasons, the power generation from renewable energy resources is increasing while conventional power plants are being shut down. This not only means a change of adopted technologies but also a change of the power flow direction in the electrical grid. The uncertainties of the renewable energy resources have to be properly dealt with using appropriate strategies, algorithms and technologies. This has to be done in order to avoid system instabilities causing complete or partial system blackouts.

This course will handle the following aspects of the changing electrical energy network:

1. Basics of Energy Engineering
2. Renewable Energy Technologies
3. Distribution Grid Planning
4. Flexibility and Smart Meters
5. Voltage Regulation
6. State Estimation
7. Protection and control functions
8. Electro-mobility

4 **Competencies**

The students successfully finishing the course should be able to

- understand the challenges in today's and future electrical energy networks
- comprehend the multiple areas of research done in the distribution grids
- develop new solution approaches for energy system problems based on their acquired knowledge.

5 **Examination Requirements**

Dependent on the number of participants the final exam is takes place as oral (30 min) or written exam (2h).

6 **Formality of Examination**

- Module Finals
- Accumulated Grade

7 **Module Requirements (Prerequisites)**

Basic knowledge in Electrical Energy Engineering

#### Content

**Course 1 or 2**

Students acquire capabilities to communicate private information in past and present, to name and ask for professions or study subjects and to query simple information on job offers. Furthermore skills to express commands or giving guidance on an entry level, to make appointments or communicate emergencies, e.g. being sick, via phone, are trained. Further skill to be trained are listed but not limited to:

- understand and phrase phone messages
- ask for explanations and express polite support requests or instructions
- query or explain a route to a target
- read or write invitations and express good wishes
- name pieces of clothing and body parts

**Course 3**

Students acquire and apply methods for self– and time–organization, to guide negotiations and presentations, organization of workflows, to handle information plethora, self and object presentation.

#### Competencies

Successful completion of this module will grant knowledge of a non–native language and will have gained or enhanced either cultural knowledge or presentation skills for the chosen target nation. Besides enhancing the general scope of education other key competences are supposed to be enabled. The necessity to freely choose classes for this subject is supposes to strengthen unsupervised learning skills and self–motivation related to academic studies.

#### Examination Requirements

3 Credits will be rewarded for either taking a class acknowledged for 1 or 2 or 3. Each class has to be passed by a final examination. Modalities of examinations are subject to the responsible lecturer. Passing the examination and assignment of credits shall be marked on a course–passing certificate.

#### Formality of Examination

- Module Finals
- Accumulated Grade

### Module Requirements (Prerequisites)

Each student who chooses a language class for the General Education subject has to opt for a language other than his or her mother language.

### Allocation to Curriculum:

Program: Automation & Robotics
## Project Group

### Course (Abbreviation)  
**AR-380**

### Language

English/ German

### Content

1. Organizing an academic task into work packages
2. Assigning the work packages to work teams
3. Processing the work packages within those work teams
4. Coordination of the work teams
5. Combining the findings of the individual work packages to a final result
6. Reviewing the results

### Competencies

By attending the Project Group, students learn to split various tasks into small work packages which then can be handled with little overlapping. The students are able to process different task requirements for example by considering deadlines and economically reasonable use of resources. They have the ability to present the results in front of an expert audience.

### Examination Requirements

The scientific subject of the Project Group’s work has to pertain to the research field of Automation and Robotics. The individual achievement of each student has to be reviewed and to be graded.

### Formality of Examination

- Module Finals
- Accumulated Grade

### Module Requirements (Prerequisites)

### Allocation to Curriculum:

#### 3 Content

1. Becoming acquainted with an academic task by using specifications
2. Analyzing scientific literature, standards and methods
3. Developing solution approaches
4. Verification and evaluation of the solution approaches
5. Selection and implementation of the most suitable approach
6. Scientific description of the methods and solutions in written form

The scientific subject of the Master Thesis has to correspond to the main subject.

#### 4 Competencies

The students have the ability to process a specified technical and scientific problem of their subject area by using scientific methods. They can evaluate subject literature by relevance and develop and implement new solutions. Furthermore the candidate is capable of presenting relevant aspects and the solution in a written description, which is scientific and well organized.

#### 5 Examination Requirements

A final talk of the student is the module exam. Apart from that the student has to participate actively in at least 5 talks of other students.

#### 6 Formality of Examination

- Module Finals
- Accumulated Grade

#### 7 Module Requirements (Prerequisites)

The Master Theses cannot be started before receiving 81 credit points within the curriculum of the Master Program.

The subject of the Master Thesis has to be assigned to the student’s major field of study.

#### 8 Allocation to Curriculum:

Program: Automation & Robotics

#### 9 Responsibility/ Lecturer

Dean of the faculty of Electrical Engineering and Information Technology
